

Unifying Results via L'Hôpital's Rule

Michael W. Ecker, Pennsylvania State University/Wilkes-Barre

*Michael W. Ecker is associate professor of mathematics at Pennsylvania State University's Wilkes-Barre campus. Having taught college mathematics since 1972, he received his Ph.D. in mathematics from the City University of New York in 1978, founded the AMATYC Review problem section in 1981, and has posed and solved hundreds of problems in numerous journals. He created several recreational math computer columns in the 1980s, and from 1986 until 2007, he edited and published his own newsletter, *Recreational & Educational Computing*.*

Can the usage of L'Hôpital's rule be stretched to unify seemingly unrelated results? Over the years, I've explored, discovered, and collected unusual and curious instances where this famed theorem may be applied. They unify results and yield insight into special or limiting cases as continuous extensions of general results. Some are fun, too, even if impractical.
